result of interaction of Ca(OH)_2 with CO_2 . C can be effected by two methods: cellular (CC) and diffusion (DC). In CC the article is placed in a chamber into which is admitted a gas rich in CO_2 (usually the gas generated during burning of limestone). The Ca carbonate that is formed binds the particles of the filler and forms the skeleton of the article. Rate of the reaction and nature of the structure of the resulting material depend upon the concentration of CO_2 , rate and extent of its penetration into the article, etc. In CC, rate of penetration of CO_2 to the center of the article can be increased by the use of autovacuum, which is effected by admitting the gas rich in CO_2 into a chamber that can be hermetically sealed, by increments at periodical intervals. The resulting reaction between CO_2 and Ca(OH)_2 is accompanied by a drastic drop in pressure within the

Title : Study of Foam-Carbonates

Orig Pub: Stroitelstvo, 1957, 4, No 3-4, 23-24.

Abstract: For the production of foam-carbonates (FC) it is necessary to carry out the process of carbonation (C) of the molded and predried articles. C can be conducted according to two methods: the chamber and the diffusion method (see RZhKhim, 1957, 12644). As a result of the performed experiments it was ascertained that in C, by either method, use can be made of the flue gases of lime-burning kilns. Flue gases of a Heat and Power Station can also be used for C, which

s/0056/64/046/006/1964/1966

AUTHORS: Zlatanov, Z. M.; Kanazirski, Kh. M.; Mincheva, L. D.;
Khristov, L. G.

TITLE: Elastic proton deuteron scattering at 6.2 GeV

SOURCE: Zh. eksper. i teor. fiz., v. 46, no. 6, 1964, 1964-1966

TOPIC TAGS: proton scattering, deuteron bombardment, heavy water,
nuclear emulsion, elastic scattering, reaction energy

ABSTRACT: With an aim at increasing the statistical accuracy of
earlier work (Z. M. Zlatanov, Kh. M. Kanazirski, P. K. Markov, L. G.
Khristov, Izv. Fiz. instituta ANEB, v. 11, 101, 1963) the authors
used a pellicle stack of 29 type NIKFI-B or emulsion of initial
thickness 400 μ , three pellicles of which were impregnated with heavy
water and the remainder with ordinary water. The stack was irradiat-
ed by the internal proton beam of the OIYAI proton synchrotron per-

ACCESSION NR: AP4042553

pendicular to the emulsion plane. A total of 20.16 cm² was area-scanned at a magnification of 630 x. Altogether 257 cases of elastic pp scattering were obtained. The differential cross section values are given for the c.m.s. range 2--9.5°. The value obtained for the elastic scattering is $\sigma_{el} = 12.6 \pm 1.4$ mb, and for the effective radius of pd interaction $R = (2.0 \pm 0.1) \times 10^{-13}$ cm. Orig. art. has: 2 formulas, 1 figure, and two tables. "The authors are grateful to the OIYaI management for cooperation and to M. G. Shafranov and P. K. Markov for help with the work."

TITLE: Elastic scattering of protons by deuterons at small angles at 6.2 GeV

SOURCE: B"lgarska Akademiya na Naukite. Fizicheski institut. Ivestiya na Fizicheskiya institut s ANEB (News of the Institute of Physics and the Atomic Energy Scientific Research Foundation), v. 11, no. 1-2, 1963, 101-104

TOPIC TAGS: scattering, elastic scattering, proton, deuteron, synchrophasotron, photoemulsion

ABSTRACT: The photoemulsion method was used to investigate elastic p-d scattering at 6.2 GeV. A stack, 9 cm in diameter and 2 cm thick, consisting of 29 emulsion layers of the NIKFI-BR type saturated with heavy water, was irradiated by the internal proton beam of the OIYaI [United Nuclear Research Institute] synchrophasotron at Dubna. The incident beam was perpendicular to the surface of the layers, and had an average density $(4.13 \pm 0.08) \cdot 10^5$ protons per sq. cm. The scanning, the measurements and identification of instances of elastic scattering were performed according to the methodology described by V. B. Lyubimov, P. K. Markov, E. N. Tsyganov, Chzhen Fu-in and M. G. Shafranov (ZhETF, 37, 910, 1959). A total of 140

Card 1/48

ACCESSION NR: AT401777

instances of elastic scattering were found. The differential cross section obtained is shown in Table 1 and Figure 1 of the Enclosure. The cross section of elastic p-d scattering in the angular interval 1.5° -- 7.5° c.m.s. was found to be $\sigma = (8.41 \pm 0.73)$ mb/sterad. The screening coefficient of deuteron was found to be 9%. "The authors cordially thank the Directorate of OIYAI [Obedineniya institut za yadreni izsledvaniya; United Nuclear Research Institute] for the irradiation and chemical treatment of the photoemulsion stack, and M. G. Shafranova for assistance rendered in the work." Orig. art. has: 4 figures, 1 table.

TITLE: Real part of the pn scattering amplitude in the energy interval 2--10 Gev

SOURCE: Zhurnal eksperimental'noy i teoreticheskoy fiziki. Pis'ma v redaktsiyu.
Prilozheniye, v. 3, no. 1, 1966, 15-21

TOPIC TAGS: proton scattering, neutron scattering, scattering amplitude, differen-
tial cross section, deuteron reaction

ABSTRACT: On the basis of experimental data obtained by the authors on elastic pn
scattering in the energy interval 1--10 Gev, and information on pp scattering ampli-
tude in this energy range, the authors determined the real part of the scattering

Card 1/2

L 24301-66

ACC NR: AF6006795

amplitude by means of an experiment involving registration of slow recoil deuterons from a film target of deuterated polyethylene 0.5--0.6 μ thick. The investigated range of the squared momentum transfer was $0.003 < |t| < 0.2$ (GeV/c)². Plots are presented of the differential cross sections vs. the square of the momentum transfer and an empirical formula is given for these plots. The value obtained for the total cross section of elastic pd scattering at 6 Gev is several times smaller than that measured by others. In the small-angle region of pd scattering, constructive interferences were observed between the Coulomb and nuclear scatterings. From the obtained real part of the pd scattering amplitude, and from a comparison of the obtained data with earlier measurements by the authors of the pp scattering amplitude of the same energies (ZhETF v. 50, 76, 1966), the estimated real part of the pn scattering amplitude is +0.2, -0.06, -0.45, and -0.40 for 2, 6, 8, and 10 Gev respectively. The small nonzero real part of the pn scattering amplitude agrees with data obtained at CERN (G. Bellettini et al., Internat. Conf on Elementary Particles, Oxford, 1965). Orig. art. has: 2 figures, 3 formulas, and 2 tables.

Title : Silex from Crni Vrh (Macedonia).

Orig Pub: Tehnika, 1956, 11, No 10, 1527 - 1529.

Abstract: The varieties of silex were studied and compared with silex from Belgian Congo. As far as the wear due to attrition is concerned, nearly all the varieties of silex are not worse than that from Congo, which makes it possible to use them in mills, as well as abrasives. Blocks of large dimensions and without fissures can be used for making rollers and mill bottoms in view of their great strength.

SOURCE: Bulgarska akademiya na naukite. Doklady, v. 18, no. 12, 1965, 1099-1102

TOPIC TAGS: radiation spectrometer, optic resolution, chromatic aberration, light aberration, optic lens

ABSTRACT: A new two-lens ironless beta spectrometer has been constructed at the Department of Atomic Physics of Sofia University. By means of several correction coils the instrument attained a satisfactory intensity with a good resolving power (1.9%). The article gives a brief description of the device and presents its characteristics. The improved resolving power is attained by 1) an increase in the inlet angle; 2) a decrease in spherical aberration; and 3) an increase in the coefficient of chromatic aberration. Maximum energy is 4.0 MeV. This paper was presented by Academician H. Hristov on 1 September 1965. Orig. art. has: 5 figures and 2 tables. [Orig. art. in Eng.] [JPRS: 36,465]

EXCERPTA MEDICA Sec.13 Vol.11/2 Dermatology, etc. Feb 57
ZLATAROV, S.

463. HOLLÓ Z. M. and ZLATAROV S. Dept. of Dermatol., Univ. Med. Sch., Szeged, Hungary. *The effect of carcinogenic agents on the phosphorus content of hair bulbs and epidermis. The effect of X-rays on the phosphorus content of the hair bulbs J. INVEST. DERM. 1956, 26/5 (379-381) Tables 1

The results indicate that hair bulbs epilated by X-rays lose most of the phosphorus they contained. This probably means that the phosphorus compounds of the hair bulbs were also completely destroyed. Considering the many various phosphorus compounds contained in the cells (acid-soluble phosphorus compounds, nucleic acids, phospholipids and phosphoproteins) and the significance of the phosphorus metabolism in the intracellular energy-production, this change is of large magnitude and may offer an explanation for the perishing of the hair bulbs.

AUTHOR: Zlatarov, V.

TITLE: Use of scintillation counters for the uninterrupted registration of cosmic radiation

SOURCE: B'lgarska akademiya na naukite. Fizicheski institut. Investiya na Fizicheskiya institut s ANEB, v. 10, no. 2, 1962, 57-69

TOPIC TAGS: scintillation counter, scintillation, scintillator, cosmic ray, counter

ABSTRACT: Examined is the possibility in principle of constructing a scintillation counter for uninterrupted registration of cosmic rays, as well as the maximum accuracy attainable with it. Such data are lacking at present. The connection between counting velocity, registered by the scintillation counter -- N /min-- and the number of particles of cosmic radiation passing through the scintillators per unit of time -- $N_{c.r}$ /min-- can be expressed as follows:

$$N = N_{c.r} K_p + N_{rand},$$

Card 1/5

L 18456-63

ACCESSION NR: AT3002412

where N_{rand} is the number of random coincidences (when registration is conducted by means of a telescope of two scintillation counters included in a coincidence scheme), and K_p is the effectiveness of the scintillation counter. Intensity of cosmic radiation is judged by reference to the velocity of counting N . To increase statistical accuracy, area of the scintillator must be large; to reduce error in measurement, K_p must be constant and N_{rand} small. Effectiveness K_p however may vary by reason of apparatus. The spectrum of impulses of a single scintillation counter (see Fig. 1 of Enclosure 1) is analyzed and it is noted that in this case error in measurement of cosmic radiation may go as high as several percentage points, "which is quite unsatisfactory." A detailed examination is made of the operation of a specially constructed apparatus, using two scintillation counters working on the coincidence principle. See block diagram in Fig. 2 of Enclosure 2. In this case, with effective area $S \sim 200$ sq. cm., and with stabilization of the photomultipliers by means of negative feedback, greatest accuracy of the apparatus is of the order $\sim 0.2\%$. Further reduction of error (to several hundredths of a percent) may be reached by using

2/5

Card

L 18456-63

ACCESSION NR: AT3002412

greater effective scintillator area (S 0.5 sq. m.). Likewise examined is a method of determining the intensity of cosmic radiation with error of the order of several tenths of a percent, by means of measuring the counting velocity on two discrimination levels. "In conclusion I wish to express my heartiest gratitude to Doctor of Physico-mathematical Sciences N. L. Grigorov for proposing the topic of this work and for the valuable consultations and discussions with him during its execution." Orig. art. has: 12 equations, 9 figures and 2 tables.

PURPOSE: This book is intended for engineers and scientific personnel concerned with the pressworking of metals.

COVERAGE: Published jointly by Mashgiz and SNTL, the book discusses the present state of the pressworking of metals in the USSR and the Czechoslovak Socialist Republic. Chapters were written by both Soviet and Czechoslovak writers. No personalities are mentioned. There are 129 references: 93 Soviet, 15 English, 8 German, 5 Czech, and 2 French.
